

Sort in ascending order -> Use "Max heap" concept in heap sort

Unsorted

Heapify ( $n, i$ )

$n$  is no. of elements  
 $i$  ranges from  $(n/2)-1$  to 0

Start from  $(n/2) - 1$

Decrement  $i$  for each function call, until 0

index in Max Heapify  
 keeps changing in every  
 iteration

Max Heapify ( $n, \text{index}$ ):

Start from index

Assign largest = index

Assign left =  $(2 * \text{index}) + 1$  -> left child

Assign right =  $(2 * \text{index}) + 2$  -> right child

Make sure that the left <  $n$ , right <  $n$

Swap the largest from left/right (if any)  
 and index

The previous largest is the new index

Repeat until largest and index are the same

Swap  $i$  and  $0$  followed by  $\text{Heapify}(i, 0)$

where  $i$  ranges from  $n-1$  to  $1$

Swap  $0$  and  $n$

$\text{Heapify}(n-1, 0)$

In each function call,  
start from  $0$ , go until  $i < n-1$

Decrement  $i$  for each function call, until  $1$

$n$  in Max Heapify keeps  
changing in every  
iteration

Max Heapify ( $n$ , index):

Start from index

Assign largest = index

Assign left =  $(2 * \text{index}) + 1$  -> left child

Assign right =  $(2 * \text{index}) + 2$  -> right child

Make sure that the left  $< n$ , right  $< n$

Swap the largest from left/right (if any)  
and index

The previous largest is the new index

Repeat until largest and index are the same

Swap 0 and n-1
